

The artifact was a course sorting program that used hash tables and nodes to sort and store courses. It was created on October 13, 2025. The inclusion of the artifact was to demonstrate my skills with data structures and algorithms. The use of hash tables shows my skills with data structures while the functions of the program show my skills with algorithms. The artifact was improved by further modularizing the program by splitting blocks of code in the main method into callable functions as part of the hash table class. I believe that I have met the outcome that I had set in module one. While improving the artifact, I learned about the different ways that C++ utilizes pointers. The only challenge that I faced while improving the program was figuring out how I wanted to split the code and how I would reimplement the new functions into the main method while keeping the program running the same as before the modifications.
